

T-1

Creeping Bentgrass

CHARACTERISTICS

T-1 *Arostis stolonifera* is the first of a new generation of creeping bentgrass, with qualities never before seen in golf turf:

- Remarkable Genetic Color – T-1 has a head turning, significantly darker green genetic color.
- Ball marks, divots heal rapidly
- Dollar spot resistance equal to the best
- “Championship greens without the championship maintenance”
- Rich green color
- Makes visible gains on *Poa annua* each year
- Great on GREENS, TEES and FAIRWAYS!

PERFORMANCE HIGHLIGHTS

Tenacious ground coverage – The single biggest factor that sets T-1 apart is ground coverage. T-1 retains ground coverage under some incredibly tough growing conditions.

Aggressive against *Poa* – At Jacklin Seed, we test every single bent strain in our breeding program against *Poa annua*. If it can't hold up against *Poa*, we pitch it. All of the plants that went into T-1 excelled at keeping *Poa* at bay. In fact, they made visible gains against *Poa* every year.

T-1 is the “Fore!giving Bent” – Unlike some earlier bents, T-1 was bred and optimized with the mid-budget golf course in mind. T-1 provides tournament-quality golf for every golf course and forgives even when climate or cultural practices are not ideal.

Turf growth habit – T-1 sets a new standard for bentgrass tiller density, providing a rich, luxurious putting surface. Yet it is remarkably easy to manage.

Recommended Seeding Rate:

New Seeding: 1-2 lbs. per 1000 ft² (5-10 g/m²)

Interseeding: 2-4 lbs. per 1000 ft² (10-20 g/m²)

and follow Dr. Brede's interseeding guidelines for timing and methods.
