

MP SUSTAIN

PROMOTES SOIL MOISTURE HOLDING TO REDUCE IRRIGATION FREQUENCY

PRODUCT BENEFITS

- Increases water holding through retention of capillary soil water
- Slows soil drying cycle to maintain healthy roots and microbes
- Biologically active organics enhance uptake of plant nutrients
- Works with wetting agents to increase water use efficiency
- Patented formulation is infinitely soluble for reliable tank mixing
- Convenient liquid formulation mixes well and is suitable for irrigation injection

MP SUSTAIN is a super absorbent liquid that, after applied to turf and horticultural soil, attracts water molecules and increases the water holding of soil. In doing so, MP SUSTAIN slows the drying cycle of soils in summer, enhancing the soil environment for microbes and turf roots alike.

Because MP SUSTAIN is stable in soil, it remains active for at least 12 weeks when applied as directed. Additionally, concentrated organics in MP SUSTAIN enhance the uptake of soil nutrients.

MP SUSTAIN compliments the performance of a normal wetting agent program. By stabilising soil moisture cycles in hot weather, the pressure placed on wetting agent to allow re-wetting is reduced and the soil environment enhanced.

MP SUSTAIN is a perfect additive for hydro-seeding, as it not only holds water around the seed mixture for longer, but it also helps bind the mulched surface to reduce erosion. In the same manner, MP SUSTAIN applied to a soil surface and left to dry, will significantly reduce dust by stabilising soil particles and preventing their migration.

Sprigging and seeding works will also obtain significant benefit from MP SUSTAIN. Apply in sufficient volume of water to deliver the spray solution to a required depth of soil and let MP SUSTAIN do the rest.

PRODUCT SPECIFICATIONS

100% Patented formulation containing linear polymers and naturally derived, soil complexing, organics.

PRODUCT INFORMATION

Composition

Translucent Brown Liquid

Net Volume

10 Litres

Greens Coverage

1.0 hectares

Fairways

0.67 – 1.0 hectares

SOIL MOISTURE RANGE

A systems approach to water use efficiency. MP SUSTAIN works well on its own but it has designed to work best when used in a system with MP STRIKE and MP SHIELD.

TRIAL INFORMATION

Moisture holding test ▼

Test description

This leachate test shows the candidate product's ability to hold onto applied moisture in soil, after free water has been allowed to drain after 1 hour and then after rewetting 48 hours later.

The lower the amount of leachate collected, the more that candidate has influenced the soil's ability to hold water against drainage. Humectants perform better at this test because they are more lipophylic (water attracting).

Results

MP SUSTAIN applied at only 10L/ha dramatically increases soil water holding capability. For best results apply 7-14 days after MP SHIELD, to ensure uniform distribution throughout the root zone.

The moisture holding results for MP TRIPLEPLAY (3-in-1 granule) is evidence of the increase performance when MP SHIELD and MP SUSTAIN are applied consecutively to the same soil. Practically speaking that means more time between irrigation events in summer.

MP SUSTAIN – DIRECTIONS FOR USE

Situation	Rate	Longevity	Comments
Greens & fine turf, lawns & landscape.	10 Litres / ha	2 – 3 months	Apply in advance of expected heat stress. Ideal for application via irrigation injection. Spray application should use a minimum dilution of 1 part MP SUSTAIN to 20 parts water (1.0 litre MP SUSTAIN in 20 litres of water). When tank mixing, always confirm compatibility via 'jar test'.
Fairways, Sportsturf, Lawn turf & landscape	15 Litres / ha	3 – 4 months
